Watch these three videos:

1. [CSS Variables And Trainings](#)
2. [How To Use CSS Variables \(Custom Properties \)](#)
3. [An introduction to CSS custom properties](#)

`var()` can have a callback value that returns a custom property value and the callback itself can be another custom propertyA value with a callback.

```
1 .fallback {  
2   --color-text: white;  
3  
4   background-color: var(--undeclared-property, black);  
5   color: var(--undeclared-again, var(--color-text, yellow));  
6 }
```

This scope includes the selector the custom property was declared for as well as any descendants of that selector
